

New Zealand Business Demography Statistics: At February 2016

Embargoed until 10:45am – 27 October 2016

Key facts

Provisional figures at February 2016 showed:

- New Zealand had 515,050 enterprises, up 1.6 percent from February 2015.
- These enterprises engaged 2.1 million paid employees (not an official employment statistic), up 2.4 percent from February 2015.
- Nearly all industries had more enterprises and employees than one year ago.
- The construction industry had 3.7 percent more enterprises and 4.8 percent more employees than at February 2015.
- Auckland region added 3.3 percent more business locations and 3.8 percent more employees over the year; the region had 34 percent of all employees.
- 2,350 enterprises engaged 100 or more employees – 70 more than at February 2015.
- More than half the number of Māori businesses were located within three North Island regions.

Commentary

- Business and employee numbers continue to rise
- Construction industry adds another 2,000 enterprises and 7,000 employees
- Nearly all regions get more employees, while Auckland adds most to business locations
- Enterprises and employees increase across all employee size groups
- Māori businesses located mostly in Waikato, Bay of Plenty, and Gisborne
- More enterprise births than deaths over four consecutive years

Note: All figures in this release are provisional and subject to revision in the next release. Enterprise and business location (geographic unit) counts in this section are rounded to the nearest 10. Employee counts are rounded to the nearest 100.

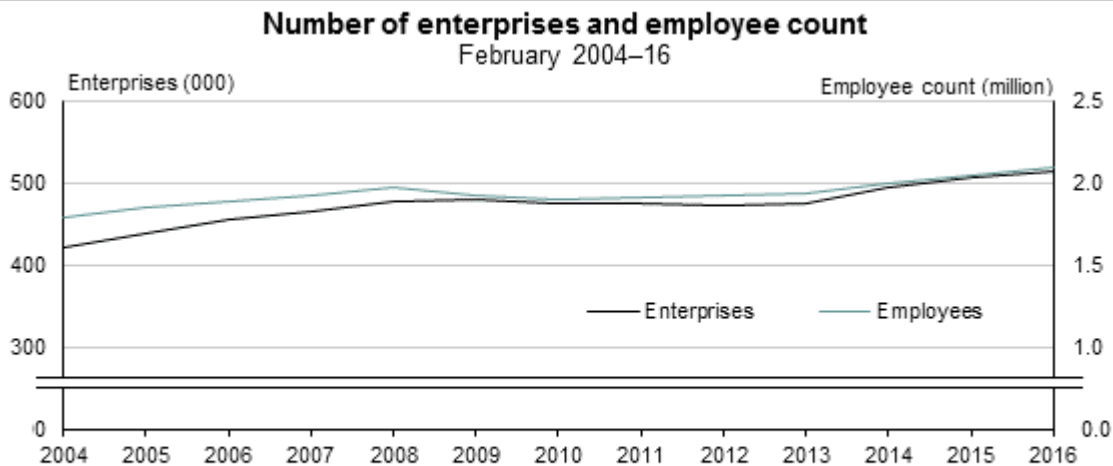

Business and employee numbers continue to rise

At February 2016, there were 515,050 enterprises in New Zealand, up 1.6 percent (8,150) from February 2015. This follows an increase of 2.5 percent between 2014 and 2015.

The number of business locations (geographic units) associated with these enterprises was 550,210, up 1.5 percent (8,170) from February 2015.

These enterprises engaged 2,102,300 paid employees. The number of paid employees increased by 2.4 percent (48,400) at February 2016 compared with February 2015.

Note: The number of employees (employee count) in this series always refers to paid employees. It is used primarily as a business size measure, not as an official employment statistic.

Source: Statistics New Zealand

Construction industry adds another 2,000 enterprises and 7,000 employees

Of the 19 industry divisions, 16 had more enterprises at February 2016 than at February 2015. Every industry except mining had more employees than one year ago.

Continuing its growth trend of the past few years, the construction industry added 6,800 (4.8 percent) more employees over the year, and the number of enterprises increased by 2,020 (3.7 percent). Following closely was the accommodation and food services industry, which had 6,700 (4.7 percent) more employees and 730 (3.7 percent) more enterprises at February 2016 than at February 2015.

The administrative and support services industry had increases of 5,700 employees (up 5.7 percent) and 260 enterprises (up 1.6 percent) over the year. Within this industry, the employment services group, which consists of employment placement and recruitment services and labour supply services, had 3,500 (8.0 percent) more employees at February 2016 than at February 2015.

The manufacturing industry continued to be the largest employer, with 235,300 employees (11 percent of all employees) at February 2016. It added 3,000 (1.3 percent) more employees and 110 (0.5 percent) more enterprises over the year. The second-largest industry by way of employment was health care and social services (224,300 employees). This industry had 4,000 (1.8 percent) more employees and 550 (3.0 percent) more enterprises at February 2016 than at February 2015.

Over the past 10 years, the number of employees in the health care and social services industry has risen by 39,000 (21.1 percent) – the highest increase of all industries. At February 2016, there were 130 hospitals, employing 80,100 (13,600 or 20.4 percent more than at February 2006). In 860 enterprises engaged in residential care services at February 2016, there were 50,000 employees. This was an increase of 7,900 or 18.7 percent from 10 years ago.

Nearly all regions get more employees, while Auckland adds most to business locations

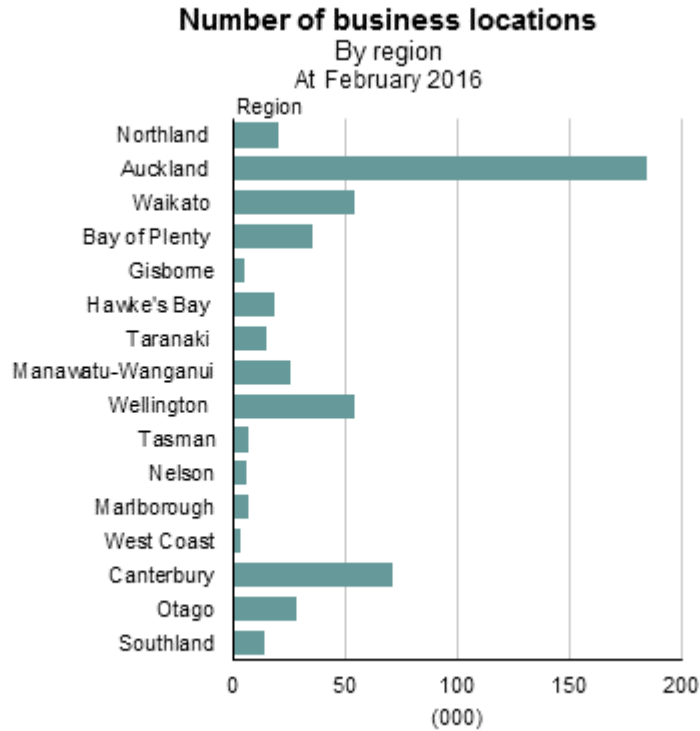

Regional data showed that between February 2015 and February 2016:

- The Auckland and Bay of Plenty regions had the highest percentage increases in the number of business locations (3.3 percent and 2.4 percent, respectively).
- The number of business locations in all other regions except the West Coast had comparatively smaller changes (1.0 percent or less).
- All regions except Taranaki and the West Coast had more employees at February 2016 than at February 2015.

Some other regional highlights:

Auckland continued to dominate the employment scene (34 percent of all employees), and over the year added another 26,600 (3.8 percent) to the number of employees in the region.

- Both the Bay of Plenty and Marlborough regions had 4.6 percent more employees than one year ago.
- Canterbury (the second-largest region in terms of business locations and employees) had a 1.0 percent rise in both the number of business locations and employees over the year. The average annual increases of the number of business locations and employees in Canterbury between 2012 and 2015 were 3.1 percent and 3.7 percent, respectively.
- The West Coast – the region with the lowest number of business locations (3,800) – had a further decrease of 2.2 percent during the February 2016 year.

Enterprises and employees increase across all employee size groups

The number of enterprises and employees increased across all employee size groups during the year to February 2016.

Enterprises with 50–99 employees had the highest percentage increase (4.3 percent) in both the number of enterprises and employees. This employee size group had 2,980 enterprises and 203,300 employees at February 2016.

At February 2016, there were 2,350 enterprises with 100 or more employees, 70 more than at February 2015. These enterprises had a total of 993,800 employees or 47 percent of all employees – an increase of 21,200 from February 2015.

Seventy percent of all enterprises at February 2016 had no paid employees.

Māori businesses mostly located in Waikato, Bay of Plenty, and Gisborne

In business demography statistics, a Māori enterprise is defined as a Māori authority or a trust, or a subsidiary of a Māori authority or a trust.

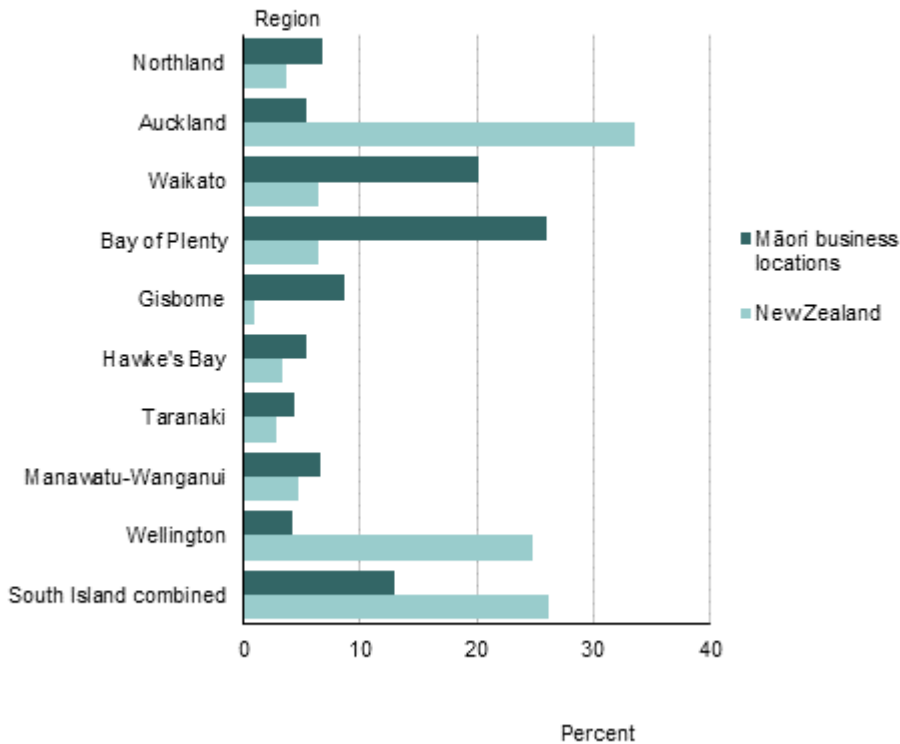

[See definitions](#) for a detailed definition.

At February 2016, regional data showed that a high proportion (54.7 percent) of Māori enterprises had business locations concentrated in three regions – Waikato, Bay of Plenty, and Gisborne.

Compared with at February 2015:

- the Waikato region (20 percent of all Māori business locations and 22 percent of all employees) had 2.2 more business locations and 13.2 percent more employees
- the Bay of Plenty region (26 percent of all business locations and 13 percent of all employees) had 4.1 percent more business locations and 3.1 percent less employees
- the Gisborne region (9 percent of all Māori business locations and 7 percent of all employees) had 3.4 percent more business locations and 2.7 percent more employees
- among the remaining regions, the South Island regions combined accounted for 13 percent of all Māori business locations and 26 percent of all employees. The South Island had 2.3 percent more business locations, and an increase in the number of employees (up 25.6 percent).

More enterprise births than deaths over four consecutive years

Provisional data showed that during the February 2016 reference year, 58,560 new enterprises started operation (enterprise births). These births represented 11 percent of the total number of enterprises at February 2016. During the same period, 53,740 enterprises or 10 percent of all enterprises ceased operation (enterprise deaths).

This was the fourth consecutive year in which the number of enterprise births exceeded the number of deaths.

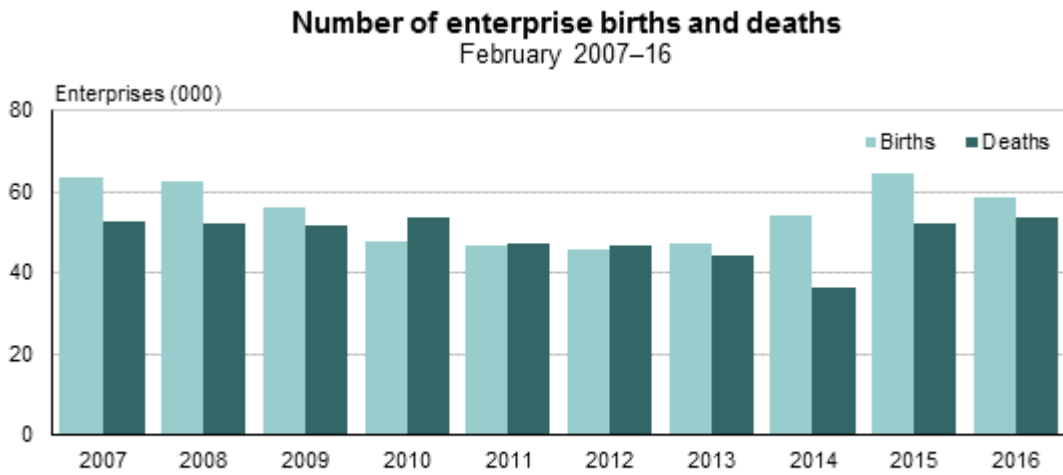

During the February 2016 year:

- non-employing enterprises accounted for 84 percent of all enterprise births and 93 percent of all enterprise deaths (this category of enterprises represented only 70 percent of all enterprises)
- enterprises that had employees in their year of birth had four employees on average.

Survival of start-up enterprises

Of the enterprises birthed in the February 2015 year, 84 percent survived until February 2016 (first-year survivors). For the longer term, only 26 percent of enterprise births in the February 2006 year survived to February 2016 (10-year survivors). This 10-year survival rate varied significantly across industries – from 36 percent for the agriculture, forestry, and fishing industry

at the top end, to 20 percent for the information media and telecommunications industry at the bottom end.

Definitions

About business demography statistics

Business demography statistics provide an annual snapshot (at February) of the structure and characteristics of New Zealand businesses. The series covers economically significant enterprises that are engaged in producing goods and services in New Zealand.

From 2016 onwards, the business demography statistics series will use the Business Register (BR) as its data source.

More definitions

ANZSIC06: Australian and New Zealand Standard Industrial Classification 2006. A business is normally assigned to an ANZSIC06 category according to the predominant activity it is engaged in. ANZSIC06 is a hierarchical classification with four levels: division, subdivision, group, and class.

Birth: occurs when a new enterprise starts operation (ie a combination of production factors is created, and no other national businesses are involved). Births do not include entries into the population due to reactivations, mergers, break-ups, split-offs, or other restructuring of a group of businesses linked by ownership or control. Changes to characteristics of existing businesses are not births (this is largely based on, and fully consistent with, the Eurostat definition of enterprise births). To be a birth in the business demography population, the enterprise and associated geographic units existed at neither time T-1 year nor time T-2 years.

See [business births and deaths](#) for more information.

Business location or geographic unit: a separate operating unit engaged in New Zealand in one, or predominantly one, kind of economic activity from a single physical location or base.

Death: occurs when an enterprise ceases operation (ie a combination of production factors is dissolved, and no other domestic businesses are involved). Deaths do not include exits from the population due to temporary inactivity, mergers, takeovers, break-ups, or other restructuring of a group of businesses linked by ownership or control. Changes to characteristics of businesses that remain active are not deaths (this is largely based on, and fully consistent with, the Eurostat definition of enterprise deaths). To be considered a death in the business demography population, the enterprise and associated geographic units exist at neither time T year nor time T+1 year.

See [business births and deaths](#) for more information.

Employee count size groups: EC data in this release is summarised into seven employment size groups:

0 EC
1–5 EC
6–9 EC
10–19 EC
20–49 EC
50–99 EC
100+ EC.

Employees or employee count (EC): refers to paid employees. It is a head count of salary and wage earners sourced from taxation data. EC data is available on a monthly basis. The EC used for deriving business demography statistics is for the February month.

Enterprise: an institutional unit that generally corresponds to legal entities operating in New Zealand. It can be a company, partnership, trust, estate, incorporated society, producer board, local or central government organisation, voluntary organisation, or self-employed individual.

Enterprise group: a grouping of enterprises in the Business Register linked by common ownership. Generally, the Business Register only records links of over 50 percent shareholding between enterprises. Types of enterprise groups are:

- **all-resident enterprise group** – an enterprise group in which all enterprises are resident in New Zealand
- **multinational enterprise group** – an enterprise group that contains one or more enterprises resident outside New Zealand
- **foreign-controlled enterprise group** – a multinational enterprise group controlled by a group head with its headquarters outside New Zealand
- **domestically controlled enterprise group** – a multinational enterprise group controlled by a group head with its headquarters in New Zealand.

Entries: enterprises that are present in the business demography population at the end of the reference period, but were not present at the start of the reference period.

Exits: enterprises that are present in the business demography population at the start of the reference period, but are not present at the end of the reference period.

Geographic unit or business location: a separate operating unit engaged in one, or predominantly one, kind of economic activity from a single physical location or base.

Māori enterprise: An enterprise is treated as a Māori enterprise if it meets one (or more) of these conditions:

- it is an enterprise (business) with a collectively managed asset that uses current Inland Revenue eligibility criteria to be a Māori authority (whether or not it elects to be a Māori authority for tax purposes)
- it is a commercial business that supports the Māori authority's business and social activities, and sustains or builds a Māori authority's asset base
- it is a business that is 50 percent or more owned by Māori authorities.

Pure birth: birth with a recent birth date. That is, the birth dates of all geographic units and the enterprise are more recent than the February snapshot of time T-2 in the business demography population. Pure births generally exclude reactivations (enterprises dormant for a period that come back into the population).

See business births and deaths for more information.

Reactivation: enterprise dormant for a period that comes back into the business demography population.

Short-lived birth: birth that disappears by time T+1 reference period in the business demography population, due either to death or dormancy.

See business births and deaths for more information.

Survival rate: the percentage of births in each reference period that survives into future reference periods in the business demography population (surviving births divided by total births for a particular reference period). To be a survivor, the new enterprise must have existed at every reference period between its birth year and the given reference period.

Surviving birth: birth that survives at least one period (until time T+1 reference period) in the business demography population.

See business births and deaths for more information.

Data quality

Quality limitations of fine-level data

We recommend caution when using fine-level regional and industry business demography data. The Business Register (BR) supports quality national-level and aggregate industry-level statistics but is not designed to provide quality fine-level regional or industry statistics. The BR update sources can have timing lags and less robust information for small and medium-sized enterprises. These quality weaknesses can be highlighted in fine-level business demography statistics.

Period-specific information

Business demography statistics series is now based on the Business Register

Up to the 2015 release, the business demography statistics series used the Longitudinal Business Frame as its data source. The Longitudinal Business Frame was constructed from all current and historic Business Frame data. The Business Register (BR) that replaced the Business Frame in 2014 allows for easy creation of longitudinal snapshots. From the current release (2016) onwards, the business demography statistics will use the BR as its data source.

General information

About the data

Regional data throughout this release use the 2013 area boundaries.

Businesses covered

Business demography statistics coverage is limited to economically significant enterprises that are engaged in producing goods and services in New Zealand. An enterprise must meet at least one of the following criteria:

- annual expenses or sales subject to GST of more than \$30,000
- 12-month rolling mean employee count of greater than three

- part of a group of enterprises
- registered for GST and involved in agriculture or forestry
- over \$40,000 of income recorded in the IR10 annual tax return (this includes some units in residential property leasing and rental).

We continually monitor enterprises recorded on Inland Revenue's client registration file to determine whether they meet the 'economic significance' requirements for inclusion. Enterprises maintained on the BR represent the target population from which Statistics NZ's economic surveys are selected.

We exclude all non-trading or dormant enterprises, as well as enterprises outside New Zealand, from business demography statistics.

Business demography data is provisional

Data on the BR is continually updated to maintain the latest information on businesses. Updates can affect the history of businesses as well. This means that statistics based on the BR can change if they are recreated from an updated version of the BR.

From 2007 onwards, we release business demography statistics provisionally to allow updates to the series to be incorporated in the next release. We expect the largest revisions in the most-recent reference periods, with smaller changes earlier in the time series. This is mainly due to the lags associated with processing administrative data, which are a key component of the BR maintenance strategy.

How businesses are represented as statistical units

Businesses are represented in the BR and the business demography statistics as statistical units. We use two types of statistical units:

- The **enterprise unit** represents the legal business entity (eg a limited company, a partnership, a trust, an incorporated society). Where a group of limited companies is linked by ownership of shares, we record each individual limited company in the statistics as a separate enterprise.
- The **geographic unit** represents a business location engaged in one, or predominantly one, kind of economic activity at a single physical site or base (eg a factory, a farm, a shop, an office). Geographic units are unique to enterprises and an enterprise unit can have one or many geographic units (business locations). Typically, an enterprise unit only has a single geographic unit, unless the enterprise has paid employees who permanently work at more than one location. Geographic units can be transferred between enterprises (eg enterprise B purchases a factory (a geographic unit on the BR) as a going concern from enterprise A).

Employee count data

We source the employee count (EC) data we publish in the business demography statistics and Linked Employer-Employee Database (LEED) from the employer monthly schedule (EMS) tax form. Conceptual differences between the business demography EC size measures and the published LEED employment statistics include:

- business demography includes employees of all ages (LEED statistics exclude employees under 15 years)

- business demography counts people employed at any time during the February month (LEED statistics only count those employed on the 15th of the reference month)
- business demography uses the EMS data before all returns are finalised. When we publish the business demography statistics, we consider the EMS data robust enough to accurately indicate business size.

Business demography does not provide official statistics on employment levels. The EC data in business demography is primarily used to support business size statistics.

- Business demography revisions each year can include updates to the EC data for previous years.
- Interpreting time series data and data limitations apply to the EC statistics and the counts of statistical units.
- The timing of seasonal business activity (eg horticultural crop harvesting) can influence the time series for some industries and regions.
- EC statistics include all employees who are paid during the month, irrespective of the number of hours or days they work. If an individual has multiple jobs during a month, with different employers, we count all jobs.
- EC statistics at the geographic-unit level for multi-geographic-unit enterprises (many business locations) are calculated by a process that includes some estimation. We proportion enterprise-unit EC data to the constituent geographic units by using survey data and administrative records on employee locations.
- Generally the EC for a geographic unit is all paid employees working at that business location. However, for industries with employees who do not work at a fixed location, we count employees at the geographic unit that represents the base, administrative, or head office of their employer (eg building and construction, transport, contract labour, health care and assistance, gardening, agriculture contracting, cleaning).
- Data users need to be cautious and understand the factors influencing EC statistics when interpreting changes over time.

EC data does not include working owners, unless they pay themselves a salary or wage that is subject to PAYE. So enterprises in the zero EC size category may have:

- working owners
- labour provided by other businesses or contractors
- business activity that requires no labour (eg passive investment).

Business births and deaths

Identifying business births and deaths

To observe business dynamics (eg births and deaths) over time, from administrative data sources, we must be able to link continuing businesses if their identifiers change in the source data. A business may undergo several changes in its lifetime, not just birth and death. For example, legal or administrative entities may close down or emerge due to breakups, mergers, split-offs, takeovers, or restructuring. Any of these events can result in the business obtaining a new unique identifier (an IRD number) in the tax reporting system and subsequently on the BR. A business would then appear as a death and subsequent birth in these systems. However, neither administrative changes nor the events mentioned above necessarily indicate a birth or death of the underlying business activity in the real world.

The methods we use to identify business births, deaths, and continuing businesses in the business demography dataset are in line with recommendations from the Organisation for

Economic Co-operation and Development (OECD) and Eurostat. The theoretical criteria we use to define each are based on a combination of factors of production (land, labour, capital). A birth is an assembly of new factors of production. A death is a disassembly of factors of production.

In practice, the information we use as proxies for these production factors, to identify continuing businesses, are whether a business:

- holds a majority of its original geographic units (business locations)
- keeps the same trading name
- is in the same industry
- continues to operate from the same location
- continues to employ most of its former employees.

In contrast, indicators for a new business (birth) are whether a business forms new geographic units, has a new trading name, and mostly recruits new employees.

See [Business Demographic Statistics Review Report](#) (published 2006) for the processes we use to identify continuing businesses on the BR (longitudinal links).

Reference period for births and deaths

We present births and deaths on an annual basis, at February. For us to count a birth or death in a reference period, it must have occurred at some stage during the year (1 March to end of February), and not have a changed status by the February reference point. For example, an enterprise that ceased operation during the year, and then started again before February, is not counted as a death.

According to Eurostat's recommendations for enterprise births and deaths, a reactivation (an existing enterprise that was dormant for a period and came back into the business demography population) after less than two years of inactivity is not counted as a death and subsequent birth. To identify births at time (T), we need to check movements in the enterprise population over more than one period (a year) – that is, at least back to time T-2 years. This also helps us to filter out temporary movements in and out of scope (as determined by the economic significance of an enterprise, which may change from one period to the next). The number of periods we can look back for births, or forward for deaths, is limited by the start and end points of the available data (the LEED holds data from April 1999 to the current month). For enterprise births in 2001, we used the snapshots of April 1999 and February 2000 as reference points. For all other birth and death reference periods, we only used snapshots for February as reference points.

Identifying enterprise births

Total entries for period T are all enterprises whose identifiers exist at time T but not at time T-1 year. Of these, **real births** are all enterprises whose geographic units existed at neither time T-1 year, nor time T-2 years.

- If an enterprise consists of more than one geographic unit, we only consider it a real birth if none of its units existed in the previous two years.
- Entries other than real births are enterprises that experience administrative changes or movements in and out of scope.

Once we identify real births on the BR using the methods above, we analyse them further by splitting real births of period T into:

- **pure births** (where birth dates of all geographic units and the enterprise are more recent than the February snapshot of time T-2 years)
- **other births** (birth dates are not recent, and are therefore likely to be reactivations)
- **surviving births** (survive at least one period until time T+1 year)
- **short-lived births** (disappear by time T+1 year, due to either death or dormancy).

Identifying enterprise deaths

Total exits for period T are all enterprises whose identifiers exist at time T-1 year but not at time T. Of these, **real deaths** are all enterprises whose geographic units exist at neither time T, nor time T+1 year.

- If an enterprise consists of more than one geographic unit, we only consider it a death if all its units disappear in the following two years.
- Exits other than real deaths are enterprises that experience administrative changes or movements in and out of scope.
- If data for time T+1 year are not available, the number of real deaths is provisional until revised after the next snapshot is available. Therefore, deaths for the more recent reference periods should be treated with caution.

Identifying geographic-unit births and deaths

These statistics are available by regional council and territorial local authority. The rules for identifying geographic unit births and deaths mirror those of enterprise units, as described above, except that the enterprise unit to geographic unit linkages are irrelevant. We do not consider existing geographic units moving between regions to be births or deaths.

Survival of enterprise births

The longitudinal nature of the BR allows us to track enterprise births in any reference period over subsequent years. Survival rate statistics can be used to analyse the survival of new births, by both industry and business size. We calculate survival rates as the percentage of births in each reference period that survive into future reference periods in the business demography population (surviving births divided by total births for a particular reference period). To be a survivor, the enterprise must have existed at every reference period between its birth year and the given reference period.

International comparability

The OECD study on international comparability of business start-up rates found that although enterprise birth rates are a key economic indicator, their availability and definition varies between countries, making comparison difficult. Eurostat and the OECD are working on standard models for business populations and standardised definitions for key indicators. The definitions and methods we use align well with the best practice models presented in the OECD study.

See [Business Demographic Statistics Review Report](#) (published 2006) for more detail.

Interpreting time-series data

Improved processes

Our business demography time-series data has several significant changes caused by improved processes. Due to data constraints, we have not attempted to remove the influence of these changes, but they are described here so customers can understand the time series.

Agriculture units (ANZSIC06 subdivision A01). For a period before 2002 the agricultural units on the BR were maintained to a lower quality level than other units on the BR (we had no agricultural production statistics programme in place). When we reintroduced a programme of annual agricultural production statistics in 2002, the BR quality improved, with business demography data for the agriculture industry being more robust from 2004. However, feedback on the BR from the agriculture programme cycle can still result in some volatility in the agriculture series. Some changes in business demography statistics for agriculture therefore reflect quality improvements in the BR, rather than actual changes.

Small drop in total enterprises from 2000 to 2001. This was influenced by a change in June 2000 to the methodology used to add new units to the BR. Under the new methodology, we only added units to the BR after administrative data sources reported the unit displayed sufficient activity to meet the BR economic significance conditions. Previously, we added non-employing units to the frame before they met these conditions. The change only affected non-employing businesses.

Significant increase in enterprises in 2004 – particularly in ANZSIC06 divisions K (financial and insurance services) and L (rental, hiring, and real estate services). This was largely a consequence of our improved use of administrative data to maintain the BR. Most enterprises added were non-employing businesses.

Changes in how we represent businesses on the BR

Structural changes in businesses, such as business mergers, one business taking over another business, or a business selling part of its activities can also affect time-series data. This can cause a significant EC data movement in an industry (ANZSIC) time series. For example, in a business takeover where one enterprise is absorbed into another, the employees of the smaller enterprise will typically become classified to the industry of the larger enterprise.

Regional business demography time-series statistics can be influenced by changes in how we represent an enterprise with many business locations on the BR. For example, a move to a less-granular or more-detailed geographic unit structure, due to changes in a way a business reports regional information, can influence regional time series.

Many enterprises undertake a range of business activities simultaneously. For example, they manufacture and wholesale goods, and their activities can be over commodities that cross ANZSIC boundaries. Enterprises are classified on the BR according to their predominant activity. Movements in time series can be caused by the predominant activity changing, which can appear to be a significant change in an industry time series. Such changes need to be interpreted carefully, because the business activity may be largely continuing, but under a different predominant industry classification.

Data limitations associated with business demography data include:

- non-coverage of 'small' enterprises that fall below the economic significance criteria

- partial coverage of enterprises in the gap between the BR economic significance condition (\$30,000 of sales subject to GST) and the compulsory GST registration threshold (\$60,000 from 1 April 2009). We can't quantify our partial coverage, but some businesses register for GST when their activity is below the threshold
- residential property operators industry (ANZSIC06, class L6711) contains only partial coverage (analyse with care)
- lags exist in recording enterprise births and deaths
- our published time series is revised each year as we incorporate the latest BR data. Revisions of any significance mainly affect the end points of the series
- non-availability of overseas ownership information for some BR units
- information on enterprise ownership links (needed to identify BR enterprise groups) is limited to administrative data sources; direct surveys cover only large businesses
- difficulties in maintaining industrial and geographic classifications for medium and smaller enterprises (primarily maintained on BR using administrative data)
- some classification data is imputed (estimated) in back-cast ANZSIC06 statistics – apply caution when using them
- we introduced classification for Māori enterprises only in 2010. Due to small numbers, any detailed analysis of Māori enterprise and EC data should be done with caution.

Further data limitations

The numbers of business births, deaths, and surviving businesses rely on several data sources to identify a continuing business (eg one changing legal ownership and restructuring) and genuine start-ups and closures. These data sources are not comprehensive and are of lower quality for small non-employing businesses. When businesses register for GST and are added (or 'birthed') onto the BR, we give them a new reference number. Company restructuring or ownership change can result in a new GST registration being filed, even though it relates to an existing business. While the BR has procedures to identify links between new and existing businesses, we can't guarantee that all links are identified. We recommend caution in interpreting and using these statistics.

Rounding

Enterprise, geographic unit, and EC counts in the tables in this release are randomly rounded. Due to rounding, individual figures may not sum to the stated total(s). Derived figures (eg percentage changes) are calculated using unrounded data.

NZ.Stat allows you to organise data in the way that best meets your needs. You can view the resulting tables onscreen or download them.

New method for confidentialising business demography tables for 2016

This is the first release of 2016 business demography data. This year this first release includes only high-level tables – it does not include any NZ.Stat tables.

Changes to the 2015 business demography dataset were a concern to many users. Our legal boundaries constrained what data we could release, and the confidentiality method we used in 2015 rendered our NZ.Stat tables unusable for many. Statistics NZ is committed to making more data available, not less. Balancing confidentiality and our current legislative environment with the desire to release more data has driven our work over the last year to develop a more workable solution for business demography.

We have a [new method for confidentialising business demography tables](#) that we would like to introduce to you. We aim to load the new tables that used this method on our innovation website in mid-November. You will have the opportunity to work with the data tables on the innovation website and send us your feedback by 1 December.

Our intention is to publish a second business demography release for the 2016 period with detailed tables in early December. Customised requests will be processed promptly following this release. If the delay is of concern to you please email Mary Reid at mary.reid@stats.govt.nz.

[Introducing new method for confidentialising business demography tables](#) has more information.
