

New Zealand Income Survey: June 2015 quarter

Embargoed until 10:45am – 02 October 2015

Key facts

In the year to the June 2015 quarter:

- Median weekly income from all sources (for all people) increased by \$26.
- Median weekly income from government transfers (for those receiving income from this source) increased by \$12.
- The number of wage and salary earners increased by 2.8 percent, and the number of full-time earners increased by 3.2 percent.
- Median hourly earnings increased by 83 cents.
- Median weekly income from wages and salaries (for those receiving income from this source) increased by \$19. This change is not statistically significant.

All income figures in this information release refer to gross (before tax) income for individuals.

	June 2015 quarter	Annual change	
	(\$)	(\$)	(Percent)
Median weekly income from all sources ⁽¹⁾	621	26	4.3
Median weekly income from government transfers ⁽²⁾	315	12	4.0
Median weekly income from wages and salaries ⁽²⁾	882	19	2.2
Median hourly earnings	22.83	0.83	3.8

Commentary

- [Median weekly income increases 4.3 percent](#)
- [More full-time earners push up hourly earnings](#)

All income changes in this information release are [statistically significant](#) unless otherwise specified.

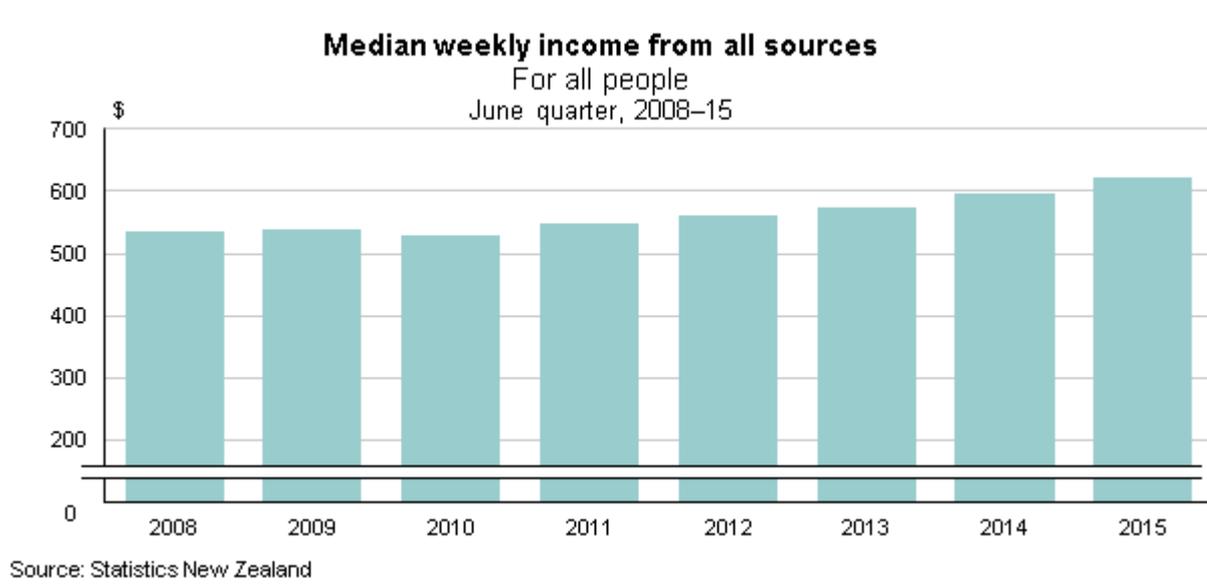

All income figures in this information release refer to gross (before tax) income for individuals.

Note: On 31 August 2015, we revised all series from the New Zealand Income Survey (NZIS) to account for the latest population estimates following the 2013 Census. We also introduced regional benchmarks to help improve the quality of our regional income estimates. As we have changed our previous estimates, we do not recommend comparing estimates in this release with those in previous information releases.

See [New Zealand Income Survey population rebase: June quarters 1997 to 2014](#) for more information.

Median weekly income increases 4.3 percent

In the year to the June 2015 quarter, median weekly income from all sources for all people (including those with no source of income) increased by \$26 (4.3 percent), to reach \$621. Increases in weekly income from government transfers and the number of wage and salary earners, particularly those in full-time employment, contributed to the increase.

In the year to the June 2015 quarter, median weekly income from government transfers (for those receiving income from this source) increased \$12 (4.0 percent), to reach \$315. The increase was for both men and women, and for people aged 65 years and over.

[Benefit rate adjustments](#) were made to main benefits (up 0.51 percent) and to New Zealand Superannuation (up 2.07 percent) on 1 April 2015.

In the June 2015 quarter, there were (on average), 554 wage and salary earners in every 1,000 people. This is the highest proportion since the survey began in 1997. This increase in number was mostly from more full-time workers, up 3.2 percent in the year to the June 2015 quarter. Over the last three years the proportion of the population earning wages and salaries has recovered as shown in the following graph.

Source: Statistics New Zealand

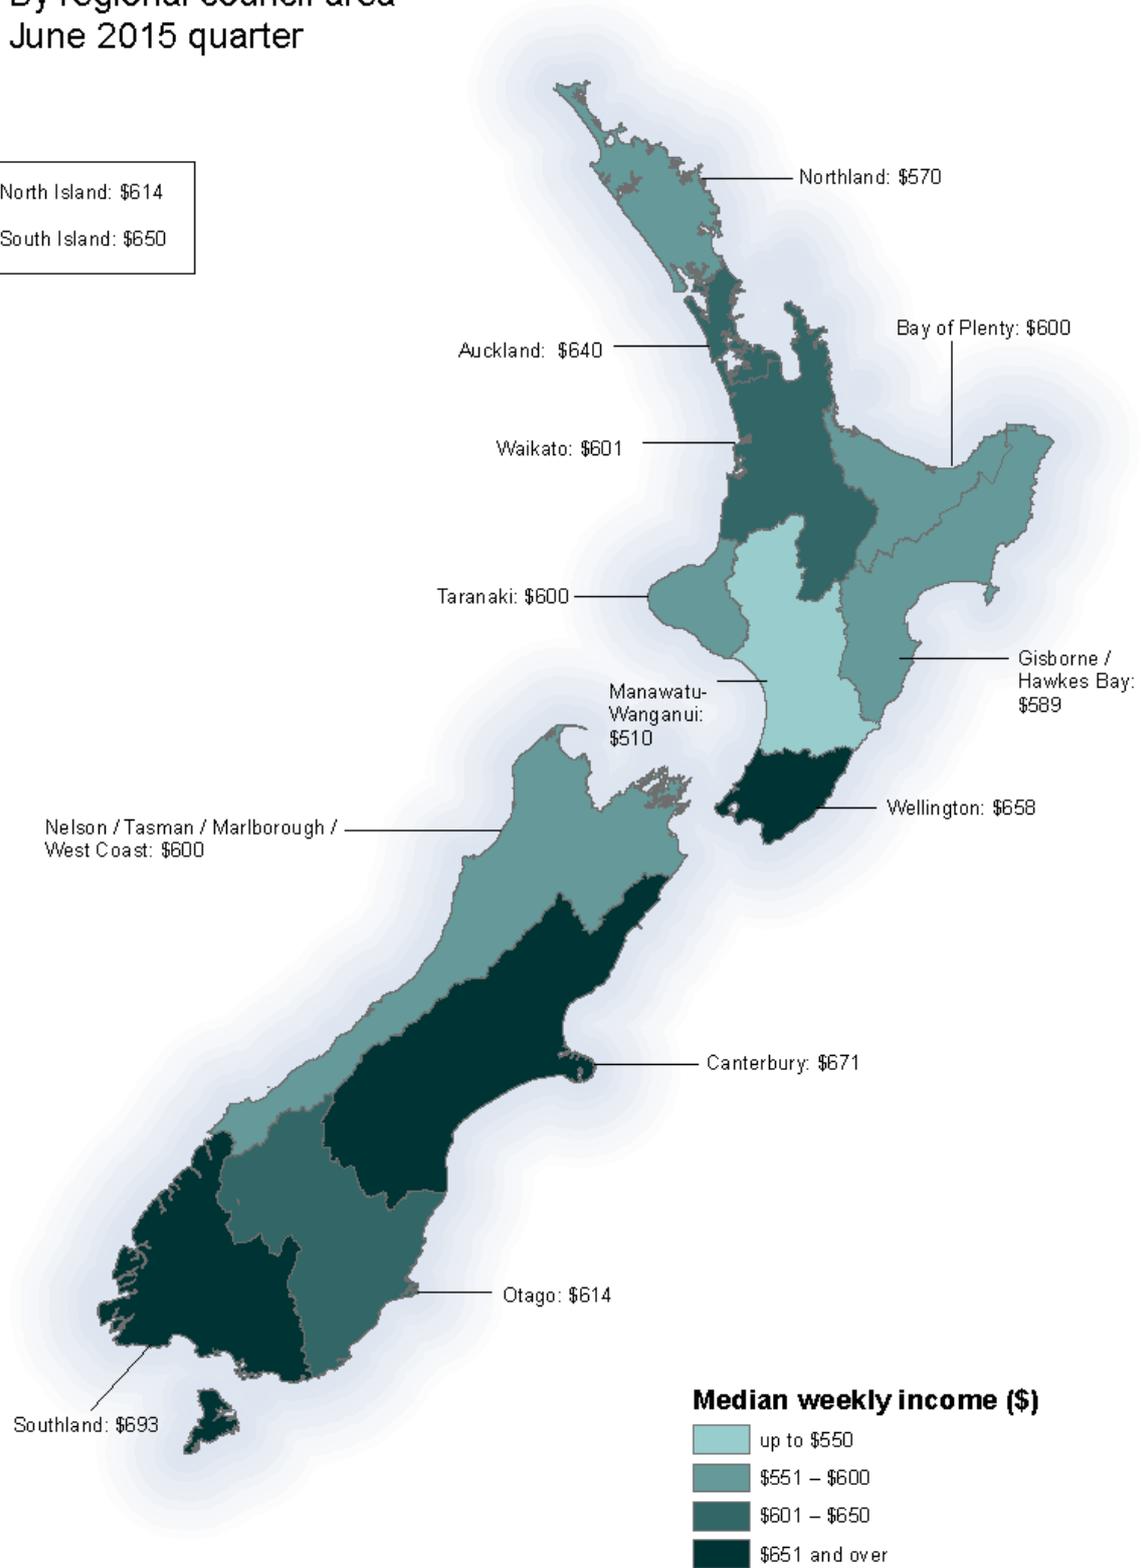

Wage and salary earners, and especially full-time workers, tend to receive higher income than the rest of the population. The greater number of wage and salary earners contributed to the rise in median weekly income for all people.

Median weekly income from all sources

By regional council area

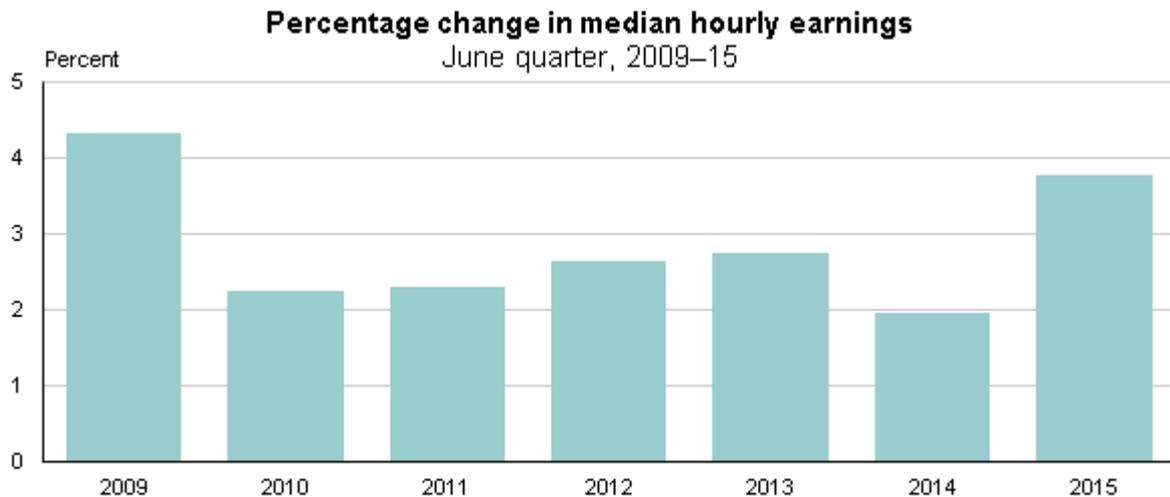

June 2015 quarter

North Island: \$614
South Island: \$650

More full-time earners push up hourly earnings

In the year to the June 2015 quarter, median hourly earnings (for those receiving wage and salary income) increased by 83 cents (3.8 percent) to \$22.83. This was the largest annual percentage increase since the June 2009 quarter.

Source: Statistics New Zealand

In the year to the June 2015 quarter, median hourly earnings for full-time wage and salary earners increased by 87 cents (3.7 percent) to \$24.36. The proportion of full-time wage and salary earners was 76.9 percent in the June 2015 quarter, the highest since the survey began in 1997.

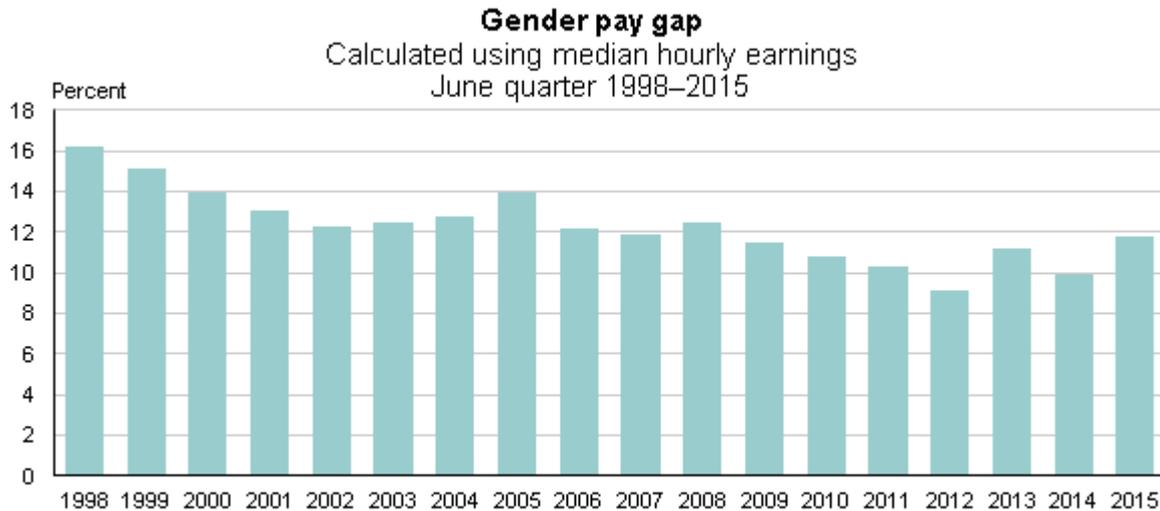

A higher proportion of full-time workers and higher earnings from full-time employment both contributed to the increase in median hourly earnings.

In the year to the June 2015 quarter, median hourly earnings also increased in some subgroups.

Sex

Median hourly earnings for men increased \$1.06 (4.6 percent) to \$24.07 while median hourly earnings for women increased non-significantly, up 50 cents (2.4 percent) to \$21.23. The increase for men was driven by more full-time workers, up 4.4 percent, and by higher median full-time hourly earnings, up \$1.00 (4.2 percent) to \$25.00.

The gender pay gap is a way to understand the differences in pay for males and females. The changes in hourly earnings for men and women resulted in a gender pay gap of 11.8 percent in the June 2015 quarter, compared with 9.9 percent in the June 2014 quarter, and 11.2 percent in the June 2013 quarter.

Source: Statistics New Zealand

See [Measuring the gender pay gap](#) for more information.

Ethnicity

Median hourly earnings increased for the following ethnic groups:

- European – up 95 cents (4.1 percent) to \$23.97
- Pacific people – up \$1.05 (5.8 percent) to \$19.18
- Asian – up \$1.34 (6.8 percent) to \$21.00.

Occupation and industry

Median hourly earnings also increased for:

- labourers occupation group – up \$1.00 (6.3 percent) to \$17.00
- retail trade and accommodation industry – up 63 cents (3.9 percent) to \$16.63
- manufacturing industry – up \$1.46 (6.8 percent) to \$23.04
- arts, recreation, and other services industry – up \$2.08 (11.1 percent) to \$20.83

For more detailed data, see the Excel tables in the 'Downloads' box.

Definitions

About the New Zealand Income Survey

The New Zealand Income Survey (NZIS) produces a comprehensive range of income statistics. This allows analysis of the links between labour force status, educational achievement, and income of individuals and households, both at an aggregate level and for sub-populations of interest.

The information is used to make policy decisions on economic and social issues that affect all New Zealanders, including retirement, education, income tax, minimum wage, and infrastructure developments. The government uses this information to estimate the number of people who could be affected by changes in legislation, and what those effects might be.

The NZIS is run annually as a supplement to the Household Labour Force Survey during the June quarter (1 April to 30 June). It ran for the first time in the June 1997 quarter.

More definitions

Actual pay: what the respondent actually earned in their last pay period or in the reference week.

Average (mean): the average value – the mean is calculated by adding two or more figures and dividing the sum by the number of figures.

Employed: people in the working-age population who did one of these during the reference week:

- worked for one hour or more for pay or profit in the context of an employee/employer relationship or self-employment
- worked without pay for one hour or more in work that contributed directly to the operation of a farm, business, or professional practice owned or operated by a relative
- had a job but were not at work due to own illness or injury, personal or family responsibilities, bad weather or mechanical breakdown, direct involvement in an industrial dispute, or leave or holiday.

Full-time employment: when an employee works 30 hours or more a week.

Government transfers: income from benefits, working for families tax credits, paid parental leave, student allowances, ACC payments, New Zealand Superannuation, and veteran's and war pensions.

Hourly earnings: number of hours usually worked and the usual income, rather than the hours actually paid for and actual hours worked.

In paid employment: people who receive self-employment income and/or income from wages and salaries. 'Not in paid employment' are those who do not fit the 'in paid employment' category. These people may or may not have a source of income.

Labour force status: people in the working-age population are either employed, unemployed, or not in the labour force.

Median: the point at which half the people receive more and half receive less than the stated amount.

Since the 2008 release a greater emphasis has been put on medians, because extremely high or low incomes tend to have less influence on median amounts than they do on an average (mean) figure.

Not in the labour force: anyone in the working-age population who is not employed or unemployed. This residual category includes people who:

- are retired
- have personal or family responsibilities such as unpaid housework and childcare
- attend educational institutions
- are permanently unable to work due to physical or mental disabilities
- were temporarily unavailable for work in the survey reference week
- are not actively seeking work.

Other transfers: a category in the tables that refers to the sum of private superannuation and other private transfers, including pensions and annuities.

Part-time employment: employment in which the employee works less than 30 hours a week.

Quintile: one-fifth of the population. The bottom quintile in terms of income represents the 20 percent of the population with the lowest personal incomes, while the top quintile represents the 20 percent of the population who receive the highest incomes.

Quintile boundary: the dollar value at which the quintile falls. For example, if quintile one (the bottom quintile) had income below \$200 a week, the quintile boundary between quintiles one and two would be \$200.

Sampling error: a measure of the variability that occurs by chance because a sample rather than an entire population is surveyed.

Statistically significant: if a change in an estimate between quarters a year apart is larger than the associated sampling error, it is referred to as a significant change. In this release, all income changes are significant unless otherwise specified.

Unemployed: all people in the working-age population who, during the reference week, were without a paid job, available for work, and had either actively sought work in the past four weeks ending with the reference week, or had a new job to start within the next four weeks.

Usual pay: what the respondent usually earns in their pay; may be different from actual pay.

Working-age population: the population the NZIS represents. It is the same population as the Household Labour Force Survey, and consists of the usually resident, non-institutionalised, civilian population of New Zealand aged 15 years and over.

Upcoming releases

We are discontinuing the current New Zealand Income Survey (NZIS) after the June 2015 collection. From 2016, income received from wages and salaries, self-employment, and government transfers will be collected as an income module within the Household Labour Force Survey. We will no longer collect other transfers (ie private superannuation and annuities) and investment income information.

See [Future of the New Zealand Income Survey](#) for more details.

[Subscribe to information releases](#) by completing the online subscription form.

The [release calendar](#) lists all our upcoming information releases by date of release.

Period specific information

Population rebase and introduction of regional benchmarks

The New Zealand Income Survey (NZIS) is a sample survey. We use statistical weights to calculate income estimates for the total New Zealand population. Following each census we revise the weights, to make use of the latest population counts. This process is called a population rebase.

Regional benchmarks enable better estimates of income by region. They work by adjusting the statistical weights, so that the known number of people within each region is maintained.

On 31 August 2015 we implemented the population rebase and regional benchmarks for the NZIS. This resulted in the revision of income estimates from 1997–2014. The revised estimates are available on [NZ.Stat](#).

See [New Zealand Income Survey population rebase: June quarters 1997 to 2014](#) for more information about the revisions.

External data influencers

We collected data in this release in the June 2015 quarter (6 April to 5 July 2015).

Changes in income may be influenced by one-off events. Events that could have influenced the June 2015 quarter data are:

- the increase in the adult minimum wage from \$14.25 to \$14.75 (effective from 1 April 2015)

- increases in government transfer maximum rates of 0.51 percent for main benefits and student allowances (effective from 1 April 2015)
- increases in New Zealand Superannuation rates of 2.07 percent (effective from 1 April 2015).

Response rates to New Zealand Income Survey

The target response rate for NZIS is 80.0 percent of eligible Household Labour Force Survey (HLFS) respondents. The achieved response rate for the June 2015 quarter was 88.3 percent.

We calculate the response rate by determining the number of eligible individuals who responded to the survey, as a proportion of the estimated number of total eligible individuals in the sample. The following table shows the NZIS response rates for the June 2015 quarter.

New Zealand Income Survey response rates, by major sub-populations, June 2015 quarter	
Demographic	Response rate (%)
Sex	
Male	87.3
Female	89.3
Ethnicity	
European	88.7
Māori	86.3
Pacific peoples	86.7
Asian	87.0
MELAA ⁽¹⁾	82.0
Other ethnicity	91.5
Labour force status	
Employed	86.3
Not in labour force	92.0
Unemployed	93.0
Full-time employed	86.0
Part-time employed	87.3
Overall	88.3
1.MELAA-Middle Eastern/Latin American/African.	

Sampling errors

The table below summarises the main sampling errors for the June 2014 and June 2015 quarters, by income source.

See Reliability of survey estimates for more information.

Relative sampling errors for average and median weekly income for all people aged 15 years and over, June 2014 and June 2015 quarters		
Income source	Sampling error (%)	
	2014	2015
Average		
Wages and salaries	3	2
Self-employment	13	9
Government transfers	2	2
Investments	13	9
Other transfers ⁽¹⁾	22	22
All sources collected	2	2
Median		
All sources collected	2	2

1. Other transfers includes private superannuation and annuities.

Contact info@stats.govt.nz for more detailed sampling errors.

General information

Scope of the survey

NZIS is a supplement to the HLFS and as such uses the same sample population. The HLFS sample has approximately 15,000 private households, sampled randomly from rural and urban areas throughout New Zealand. We gather information for each household member who falls within the scope of the survey and meets the survey coverage rules. The final NZIS dataset has approximately 30,000 individuals.

We ask all respondents to the HLFS to participate in the NZIS. The target population of the NZIS is the usually-resident, non-institutionalised civilian population of New Zealand aged 15 and over. This population does **not** include:

- long-term residents of homes for older people, hospitals, and psychiatric institutions
- inmates of penal institutions
- members of the permanent armed forces
- members of the non-New Zealand armed forces
- overseas diplomats
- overseas visitors who expect to live in New Zealand for less than 12 months
- those aged under 15 years.

New Zealand residents living on offshore islands (except for Waiheke Island), and those temporarily overseas are not surveyed. The survey population is therefore marginally different from the target population.

Survey questionnaire

Questions relate to the respondent's most-recent pay period, except for questions on annual income, self-employment income, and investment income, which cover the 12 months before the interview. We collect the following items:

- actual and usual gross wages and salaries, for main job and up to two other jobs, by ordinary time, overtime, other income
- weeks and hours worked, matching the wage and salary components as above

- sources of latest actual gross government transfers received
- latest actual gross government transfers received, in total and from each agency (Ministry of Social Development, Inland Revenue, and Accident Compensation Corporation)
- total latest actual gross private superannuation payment(s) received
- total latest actual gross 'other private transfers including pensions, and annuities' received
- weeks covered for the transfer payments defined above
- total annual gross income received from self-employment
- total annual gross income received from investment
- total annual gross income received from all income sources (income ranges are the ones used in the 2013 Census).

The collected data relates to cash only, pre-tax (gross) income wherever possible and does not include any non-cash fringe benefits.

Questions about some forms of income are not included in the NZIS, for instance income from hobbies, casual jobs, and other sources. Therefore total income estimates from the survey may underestimate actual total income.

See [flowcharts](#) for the NZIS questionnaire. The 2015 flowchart was the same as the 2014 one.

Accuracy of the data

Reliability of survey estimates

Two types of error are possible in estimates based on a sample survey: sampling error and non-sampling error. Sampling error is a measure of the variability that occurs by chance because a sample rather than an entire population is surveyed. We revised the method for calculating sampling errors in 2012.

Contact info@stats.govt.nz for more information about sampling errors.

Non-sampling errors include errors arising from biases in the patterns of response and non-response, inaccuracies in reporting by respondents (including inaccuracies as a result of proxy interviewing), and errors in recording and coding data. Non-sampling errors are not quantified. We endeavour to minimise the impact of these errors by applying best survey practices and monitoring known indicators (eg non-response).

Proxy

Where possible, the NZIS gets information directly from each household member. However, a proxy can provide information under the following circumstances:

- for a person unable to answer on health or language grounds
- for a 15- or 16-year-old with an after-school job (parent can respond)
- for a retired couple whose only source of income is New Zealand Superannuation (one of the couple can respond)
- for a self-employed couple, or farmer, where one of the couple does the accounts for both (one of the couple can respond)
- when one person in a couple controls the finances for both (one of the couple can respond).

The proxy rate for the June 2015 quarter was 20.1 percent. This compares with 20.3 percent in the June 2014 quarter.

Sample design information

Because the NZIS is a supplement to the HLFS, it uses the same sample design. We select the sample using a two-stage stratified cluster design. Households are sampled on a statistically representative random basis from rural and urban areas throughout the North and South Islands.

Each quarter, one-eighth of the households in the sample are rotated out and replaced by a new set of households. The overlap between two surveys can be as high as one half, and some households can be asked the NZIS questionnaire twice.

Imputation

For records where there is not a valid and usable response, we use a form of imputation known as 'hot-deck imputation'. In this imputation method, a 'donor record' replaces the non-usable record in the dataset. The donor record is chosen randomly from an imputation pool of records that have similar characteristics to that of the record to be imputed.

We construct imputation pools on the basis of the following HLFS variables: age group, sex, ethnicity, highest qualification, labour force status (modified), full-time/part-time work status, and region. Imputation classes are combined in a priority order where there are fewer than 10 donor records in any particular class.

We use hot-deck imputation for three reasons:

- to maintain an accurate income distribution of the New Zealand population
- to allow the calculation and analysis of household income for a larger number of households
- to account for likely biases due to non-response.

The imputation rate for the June 2015 quarter was 11.1 percent. There is little change in the income distribution or average income figures in the dataset due to imputation.

Contact info@stats.govt.nz for further information about the imputation method, or the effects of imputation on the final dataset.

Consistency with other periods or datasets

Highest-qualification statistics

In the June 2013 quarter we updated the HLFS qualification response options. The response options now ask respondents to supply the level of the qualification (eg level 4) they obtained, rather than the type of qualification (eg national certificate in business). As a supplement to the HLFS, we changed the NZIS highest-qualification output categories to reflect this.

In previous years, the vocational or trade qualification category captured all levels of certificates and diplomas obtained since leaving school. From the June 2013 quarter, these qualifications are grouped by their level. This means those who obtained their highest post-school qualifications at level 1, 2, or 3 are now included in the NCEA level 1, 2, or 3 or equivalent categories. Also, those who gained certificates or diplomas at level 7 are output to bachelor's

degree / level 7 category.

Adopting the new highest-qualification output categories gives a continuity break in the highest-qualification series as the old output categories are no longer produced. Therefore, the June 2013 data onwards is not directly comparable with previous years.

In the June 2014 quarter, we made some improvements to the highest-qualification output categories to better meet our customer needs. This means that the June 2014 quarter highest-qualification data is not directly comparable with the June 2013 data, or with previous years.

Self-employment income questionnaire change

In the NZIS, if a self-employed respondent cannot provide their current or previous year's net profit/loss, we ask them to estimate this amount by indicating whether they receive greater than or less than a series of income values. For example, a respondent may receive a net profit that is greater than \$20,000, but less than \$25,000.

In the June 2013 quarter, we updated the self-employment income values to reflect changes in the pattern of self-employment income received. Previously, the values started at greater or less than \$30,000. However, from the June 2013 quarter onwards, the values begin at \$35,000.

See the self-employment [flowchart](#) for the June 2013 quarter for more details. The changes are written in red.

In the June 2013 quarter, 17 percent of respondents estimated their self-employment income using these values. The updated values had no major impact on self-employment income and, therefore, the self-employment income data is still comparable with previous years.

Contact info@stats.govt.nz for more information about this change.

Industry statistics

Since the June 2010 quarter, we have based industry statistics on the Australian and New Zealand Standard Industrial Classification 2006 (ANZSIC06). This aligns with the HLFS. Earlier NZIS releases used ANZSIC96, and are not comparable with those based on ANZSIC06.

See [Industrial classification](#) for more information.

Occupation statistics

Since the June 2010 quarter, we have used the Australian and New Zealand Standard Classification of Occupations (ANZSCO) to classify occupation data. ANZSCO is a harmonised classification for use in both countries. Occupation outputs defined using ANZSCO are not comparable with those in earlier NZIS releases, which were based on the New Zealand Standard Classification of Occupations 1999.

See [Occupation](#) for more information.

Ethnic statistics

Since the December 2007 quarter, the HLFS has collected ethnicity data using the 2005 New Zealand Statistical Standard for Ethnicity, with up to 14 responses captured for the ethnicity question. Under the total response method, we count people who report more than one ethnic

group once in each group reported. This means the total number of responses for all ethnic groups can be greater than the total number of people who stated their ethnicities.

We have used the total response method to publish ethnicity statistics in the NZIS since the June 2009 quarter. Before then, the NZIS used the prioritisation method, where a single ethnic group was assigned to individuals who answered with more than one ethnicity.

Adopting the total response method gives a continuity break in the ethnicity series, as the prioritisation of ethnic groups is no longer produced. We can only produce the total response ethnicity series for 2008 onwards.

See [Statistical Standard for Ethnicity – 2005](#) for more information about the 2005 New Zealand Ethnicity Standard Classification.

Computer-assisted interviewing

In 2005 we introduced computer assisted interviewing (CAI) to the NZIS. We completed implementation in 2007. During the transition to CAI, we compared estimates for the CAI part of the sample with estimates from the remainder of the sample, and no statistically significant differences were detected.

The main benefits of CAI are improved data quality through better-controlled interviews, and modest resource savings through eliminating some processing steps and centralising others. We interview seven-eighths of the sample by computer-assisted telephone interviewing and one-eighth by computer-assisted personal interviewing.

All sources income

The introduction of income from investment in 2002 caused a discontinuity in time series for the 'all sources' category. Before 2002, this category included wages and salaries, self-employment, government transfers, and other transfers. Since 2002, it also includes income from investment and so the category is not comparable with previous years.

Household statistics

The household categories incorporate the concept of dependent children rather than just children. A child is a person of any age who usually resides with at least one parent (natural, step, adopted, or foster), and who does not usually reside with a partner or child(ren) of his or her own. Statistics NZ defines a 'dependent child' as a child aged under 18 years and not in full-time employment.

The household income statistics table in this release excludes households where all members are outside the ages of 18 to 64 years. This exclusion primarily affects 'couple only' and 'one person' households. These households typically contain two distinct groups of the population: couples and single people who are likely to be in the labour force, and couples and single people who are primarily retired. Because these groups can have very different income characteristics, the household income table excludes older households where all members are aged 65 years and over (65+). The income figures for 'couple only' and 'one person' households for those aged 65+ are available from Statistics NZ on request.

Interpreting the data

Compositional effects

Movements in average and median income statistics are influenced by many factors. As well as changes in levels of income, movements are also influenced by the population's composition from survey to survey. These changes occur between males and females, different ethnic groups, different labour force statuses, numbers of full-time and part-time workers, between or within industries, and between or within occupations.

Income averaged across all people from all sources includes those who have zero income for some income sources. Income averaged across those receiving income from a particular source only includes those who received income from that source.

See [User guide for wage and income measures](#) for more information on income measures at Statistics NZ.

Period effects

The NZIS reports on 'weekly income' that relates to a week during the June quarter – it is a snapshot in time. Conversion of this weekly income into an annual equivalent is not recommended as an individual's circumstances can change significantly during a year (eg change of job or a period out of work).

Tables

In this information release, all tables showing wages and salaries include usual income figures rather than actual income figures

Confidentiality and access to the data

Suppressed estimates

Cells that represent fewer than 1,000 people are suppressed and appear with the symbol 'S' in the tables. These estimates are subject to sampling errors that are too great for most practical purposes. We may remove records for quality and confidentiality purposes in some publications.

Customised data

The tables in this information release are not a full set of the possible analyses that could be carried out from the NZIS data. We can customise data requests to users' specifications.

Contact info@stats.govt.nz for more information about customised data.
